

Making Joomla! better

Contributed by Lawrence
Sunday, 25 February 2007

The discussions which came out of the second Melbourne Joomla! User Group meeting surrounded ways of making Joomla! and the associated third party software better.

Ways that were suggested:

- Unify or converge the Community Builder and ACL development pools
- Mature the events and calendar applications to interact with ACL. Some already integrate with CB, but it needs more flow on benefits.
- Simplify the process from a users perspective of managing the 3rd Party application stack. Having 1300 components, modules and plugins to choose from, whilst showing a wide range of choice, stops cross fertilisation and management. How does the end user know they are picking the right application for their needs?The JoomlaMUG was also seen in action..

We've also set up a place for Melbourne related tech tips, so if you want to share Joomla! related tips to the rest of Melbourne, just ask for an account upgrade.
